

## Sorting an Array Exercise

1. Write a program that asks the user to enter the name and song length (in minutes) of 10 songs. Store the names of the songs in one array and the duration of the song in a 2<sup>nd</sup> array. Next, sort the songs so that they are in alphabetical order (ascending...A to Z). Be careful when you sort the arrays to ensure that both arrays are sorted at the same time. Data integrity!
